

Dear clients and business associates,

This newsletter touches on the themes of handling and logistics. Appropriate handling of your parts during storage and transportation at the factory or on the way to you is of great importance for the quality thereof. In recent months we made certain investments in these fields and improved the whole cycle. By now four machines and units were equipped with loading cranes; three machining centers have vacuum clamping systems.

Sincerely yours,

*Matthias Vetter, Stefan Vetter and Till Wuertemberger*

## Delivery

As for clients in the neighborhood (Pforzheim and Enzkreis) we deliver them goods mainly by our own vehicles. All other clients within the country and abroad receive our deliveries exclusively through reliable courier services and forwarding agencies which work with proper vehicles and experienced freight forwarders:

In order to reduce forwarding costs we make supplies to our clients with UPS, DHL and TNT at their own expense (but on better terms).

Our delivery van with place for 3 EUR-pallets

Reusable case, closable, suitable for lift truck

The crane for heavy work pieces or pre-equipped clamping systems

Certification according to  
DIN EN ISO 9001:2008

## Reusable cases

Reusable cases designed specially for your parts offer maximum protection during transport and effectively contribute to environmental programs of a company. Configuration and lettering are subject to individual discussion. For small parts there are Euro stacking containers with blister pack. Both are also with ESD protection available.

## Intraplant transportation

Immediately after the delivered materials are inspected on receipt and approved, the work pieces shall be completed on shelf trucks or on pallets and than they pass the production process accompanied by manufacturing documents. Large size of parts and corresponding weights of work pieces made the use of cranes for various machines necessary. This way of loading saves the backs of our workers, as well as the surfaces of the work pieces. Thanks to the vacuum clamping systems scratches and pressure marks became things of the past.

## Cleaning of parts

Except for the existing cold cleaner washing machine we have also a degreasing machine installed so that we can meet ever toughening requirements to surfaces free of grease.

## Compressed air supply

Our turnkey compressed air unit was modified (compressor, boiler and dryer). As before there is a reserve compressor available, which starts automatically if the main machine is broken down or undergoing maintenance.

## Next newsletter

The next newsletter is expected in December 2013 with the information about environmental control, particularly for those clients having an environmental management system according to ISO 14001.

Single item and batch production: completing items on shelf trucks

Degreasing machine for preparation of subassemblies to soldering and welding

Failure safety: 2nd compressor for the compressed air supply system
